Final Exam (December 18, 2006)

Please read the problems carefully and answer them in the space provided. Write on the back of the page, if necessary. Show all your work. Partial credit will be given unless specified otherwise.

Problem 1 (5 pts, justify your answer):

A body of mass M slides a distance d along a horizontal surface with a coefficient of kinetic friction $\mu_s$. Determine how much work is done by gravity.

a) mgd
b) zero
c) $-mgd$
d) One cannot tell from the information provided.
e) None of these is correct.

Problem 2 (5 pts, justify your answer):

A golf ball and a ping-pong ball are dropped from the same height in a vacuum chamber. When they have fallen halfway to the floor, they have the same

a) speed.
b) potential energy.
c) kinetic energy.
d) momentum.
e) speed, potential energy, kinetic energy, momentum.

Problem 3 (7 pts, justify your answer):

Santa and his new turbo-charged sled are heading due east. Santa’s airspeed indicator shows that the sled is moving at a speed of 370 km/h relative to the air. If the wind is blowing from the south at 92.5 km/h, the velocity of the sled relative to the ground is

a) 357 km/h at 14 degrees east of north
b) 381 km/h at 104 degrees east of north
c) 381 km/h at 76 degrees east of north
d) 357 km/h at 76 degrees east of north
e) 381 km/h at 14 degrees east of north
Problem 4 (8 pts, show your work):

A mass $M$ attached to a string is released from rest at point $A$. Determine the tension in the string as it passes through the lowest point of its motion $B$.

\[
\begin{align*}
A & \quad M \quad R \quad R/2 \\
& \quad B \\
\end{align*}
\]

Problem 5 (8 pts, show your work):

As shown in the sketch below, 5 kg box slides into a spring of spring constant 310 N/m compressing it 24 cm.

a) (3 pts) What is the incoming speed of the block?

b) (5 pts) How long is the box in contact with the spring before it bounces off in the opposite direction?
Problem 6 (7 pts, no need to justify, be careful, within each part no partial credit will be given):

For each part below, indicate the direction of the specified quantity referring to the sketch. Your choices are left, right, up, down, into the paper, out of the paper and no direction (either not a vector or has a magnitude of zero).
Problem 7 (10 pts, show your work):

Sammie the Fish, a Gambino crime family thug operating in the waters off the Port of New York, has instructions to eliminate Slow Joe the Carp who is half-brother of Ariel the Little Mermaid. Sammie plans to carry out his evil deed by dropping a rock on Slow Joe as Slow Joe swims beneath him. When the time comes, Sammie spots Slow Joe swimming in a straight horizontal line at a speed of 1 m/s and sets his trap. Sammie picks up a 3 kg rock (with specific gravity of 2.4) in his teeth and swims to a height (h) of 10 m above the level where Slow Joe is swimming. If Sammie is to drop his rock and hit Slow Joe, how far is slow Joe horizontally from Sammie (how large is x in the sketch below) when Sammie releases his rock? (Assume the seawater has a specific gravity of 1.)
Problem 8 (10 pts, show your work):

Your buddies in the fraternity next door ask for your help in putting up a sign in front of their house. The sign is rectangular (1.2 meters x 1.0 meter) and is supported at one corner by a pin (about which the sign is free to rotate) and in the other corner by a cable that makes an angle of 20 degrees with the horizontal. The basic configuration is shown in the sketch below. The sign has a mass of 5 kg that is distributed uniformly. Assume the pin is at the exact corner of the sign for simplicity. At equilibrium the cable has a tension of 22 N. Determine the direction and magnitude of the force on the pin at equilibrium.
Problem 9 (10 pts, show your work):

A uniform rod of length L and mass M rests on a frictionless horizontal surface. The rod is pivoted about a fixed frictionless axis at one end. The rod is initially at rest. A bullet traveling parallel to the horizontal surface and perpendicular to the rod with speed v strikes the rod at its center and becomes embedded in it. The mass of the bullet is one-sixth that of the rod.

a) (6 pts) What is the angular velocity of the rod after the bullet has become embedded?

b) (4 pts) What is the ratio of the kinetic energy of the system after the collision to the kinetic energy of the bullet before the collision?

Problem 10 (10 pts, show your work):

A “U-shaped” tube with a bottom horizontal portion of length 0.2 m contains a liquid. What is the difference in height (h) between the liquid columns in the vertical arms if the tube is accelerated toward the right with an acceleration of 2 m/s².
Problem 11 (10 pts, show your work):

Two masses are connected with a massless cable that passes over two massless, frictionless pulleys as shown below. The masses start from rest and are released. The left-hand pulley is attached to the ceiling. The right-hand pulley moves up and down with \( m_2 \). Please determine the correct expression for the magnitude of the acceleration of \( m_1 \). As shown in the sketch below, the direction of this acceleration is defined to be positive upward. The correct expression is one of the six answers listed below. You must show your work to receive credit for this problem.

\[
\begin{align*}
(a) \quad a &= g \\
(b) \quad a &= \left( \frac{m_2 - m_1}{m_2 + m_1} \right) g \\
(c) \quad a &= \frac{g}{2} \\
(d) \quad a &= \left( \frac{m_2 - 2m_1}{m_2 + 2m_1} \right) g \\
(e) \quad a &= \left( \frac{2m_2 - m_1}{2m_2 + m_1} \right) g \\
(f) \quad a &= \left( \frac{m_2 - 2m_1}{m_2 + 4m_1} \right) g
\end{align*}
\]
Problem 12 (10 pts):

After graduation you start a Hollywood movie and cuticle consulting business. Ace Frick, the world famous action movie producer, comes to you with a question. He says, “My problem is that every time we send a car horizontally over a cliff, the nose of the car dips down (as shown in the strobed photograph below). You see, in this action scene I want the car to remain horizontal as it falls after being driven off the edge of the cliff at a high speed. Can you tell me why the car does not stay horizontal as it flies through the air? Why is it that the nose dips?”

Below, please provide a brief answer to Ace’s question using the physics principles you have learned in Physics 113. Feel free to use equations, sketches or formulas if you wish, but try to make the answer coherent and logical.
\[
\sin \theta = \frac{\text{opp}}{\text{hyp}} \\
\cos \theta = \frac{\text{adj}}{\text{hyp}} \\
\tan \theta = \frac{\text{opp}}{\text{adj}} \\
v = v_o + at \\
x = x_o + v_o t + \frac{1}{2} at^2 \\
x = x_o + \left( \frac{v_o + v}{2} \right) t \\
v^2 = v_o^2 + 2a(x - x_o) \\
x - x_o = \int_{t_0}^{t} vdts \\
v - v_o = \int_{t_0}^{t} adts \\
\sum \vec{F} = m \vec{a} \\
F_{\text{friction}} = \mu_k N \\
F_{\text{friction}} = \mu_s N \\
F_{\text{centripetal}} = \frac{mv^2}{r} \\
circumference \text{ of circle} = 2\pi r \\
area \text{ of circle} = \pi r^2 \\
\text{quadratic equation} = -b \pm \sqrt{b^2 - 4ac} \quad \frac{d(x^n)}{dx} = nx^{n-1} \\
\int x^n dx = \frac{x^{n+1}}{n+1} \\
\vec{F}_{\text{spring}} = -k(\vec{x} - \vec{x}_o) \\
\text{work} = \int F \cdot ds \\
\text{power} = \frac{dv}{dt} \\
\vec{A} \cdot \vec{B} = |\vec{A}| |\vec{B}| \cos \theta = A_x B_x + A_y B_y + A_z B_z \\
s = r\theta \\
v = r\omega \\
a = r\alpha \\
\omega = \omega_o + at \\
\theta = \theta_o + \omega t + \frac{1}{2} \alpha t^2 \\
\text{KE}_{\text{translation}} = \frac{1}{2} MV^2 \\
\text{KE}_{\text{rotation}} = \frac{1}{2} I\omega^2 \\
I = \sum m_i r_i^2 = \int r^2 dm \\
X_{cm} = \frac{\sum x_i m_i}{M} = \int \frac{x dm}{M} \\
I = I_{cm} + mh^2 \\
\ddot{\rho} = \vec{r} \times \vec{F} = I\ddot{\omega} = \frac{dL}{dt} \\
L = \vec{r} \times \vec{p} = I\vec{\omega} \\
P = P_o + \rho gh \\
\text{AV} = \text{constant} \\
P + \frac{1}{2} \rho v^2 + \rho g y = \text{constant} \\
I = \frac{1}{12} mL^2
