Schrödinger

$$-\frac{\hbar^2}{2m} \frac{d^2 \psi(x)}{dx^2} + V\psi(x) = E\psi(x)$$

Annotations:

- $\hbar = h/2\pi$  (orange circle)
- mass (blue arrow pointing to  $m$ )
- spatial dependence (pink arrow pointing to  $x$ )
- input force here (pink arrow pointing to  $V$ )
- energy (orange arrow pointing to  $E$ )

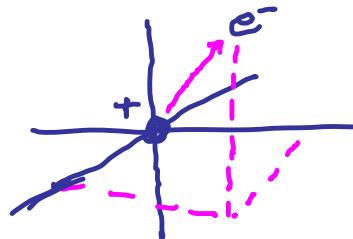

Heisenberg

Time independent  
Schrödinger equation

wave equation for  
waves/particles [can have mass]

$\psi(x) \equiv$  Wave function

$$-\frac{\hbar^2}{2m} \frac{d^2\psi(x)}{dx^2} + V\psi(x) = E\psi(x)$$

For H atom input spherically symmetric Coulomb force here

Then solve

- :
- : get discrete/quantized STATES  
of energy and spatial position

Only discrete energies and spatial states allowed  
for the electron to occupy → orbital

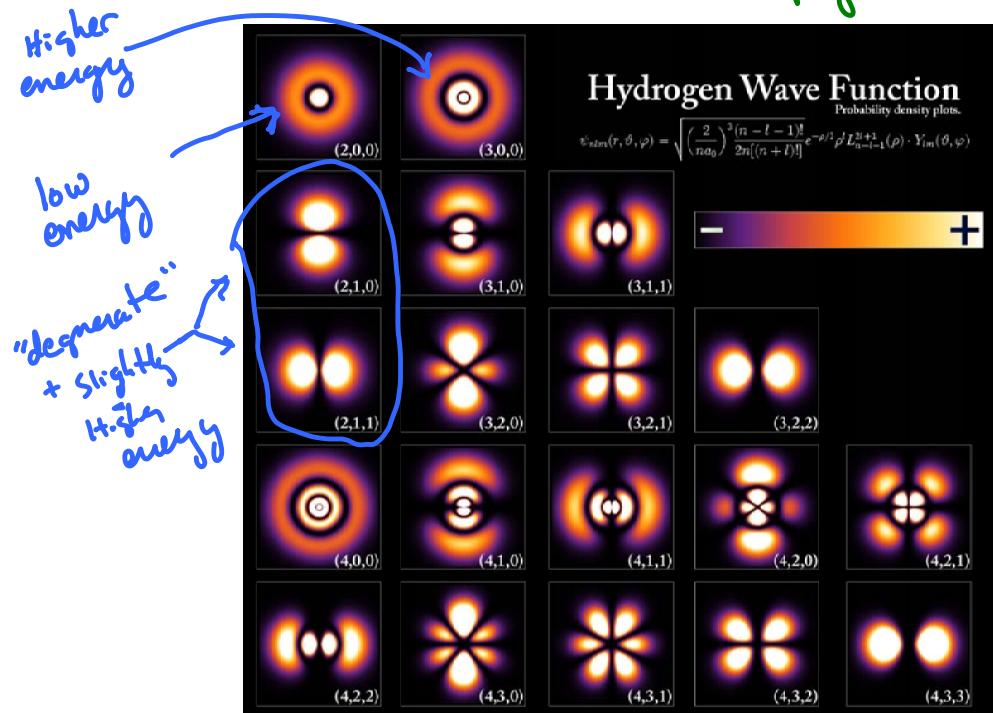

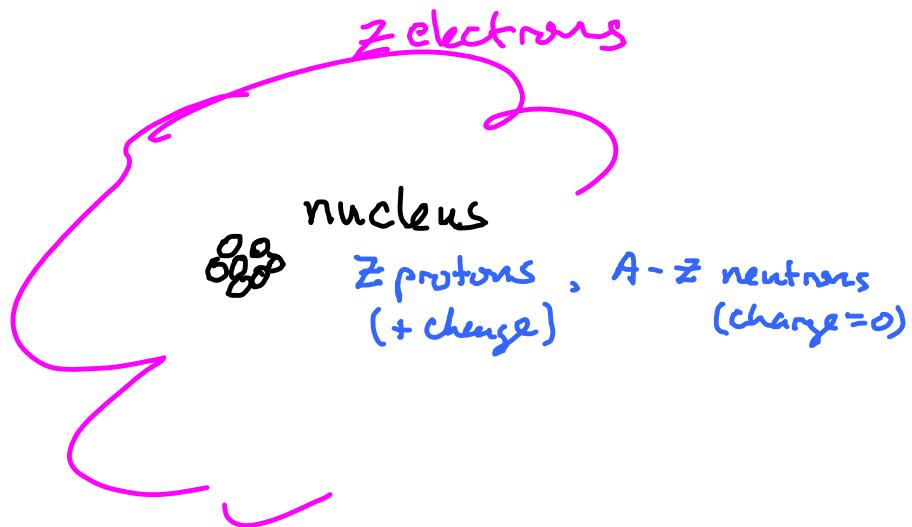

figure from [http://en.wikipedia.org/wiki/File:Hydrogen\\_Density\\_Plots.png](http://en.wikipedia.org/wiki/File:Hydrogen_Density_Plots.png).

as  $Z$  increases  
# electrons increase  
How do they populate  
Available STATES/orbitals ?

→ particle promiscuity  
is important

## Stern-Gerlach experiment - 1927

→ Discovery that electrons have Spin

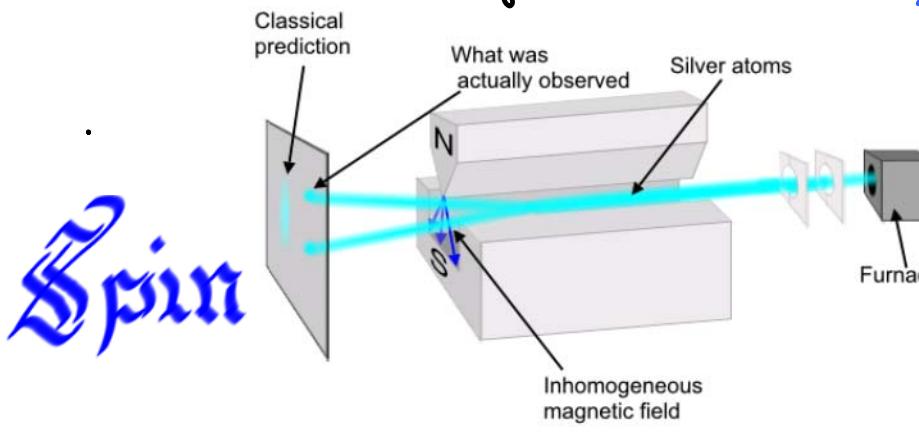

Diagram from  
Wikipedia

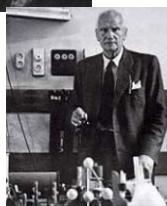

OTTO STERN

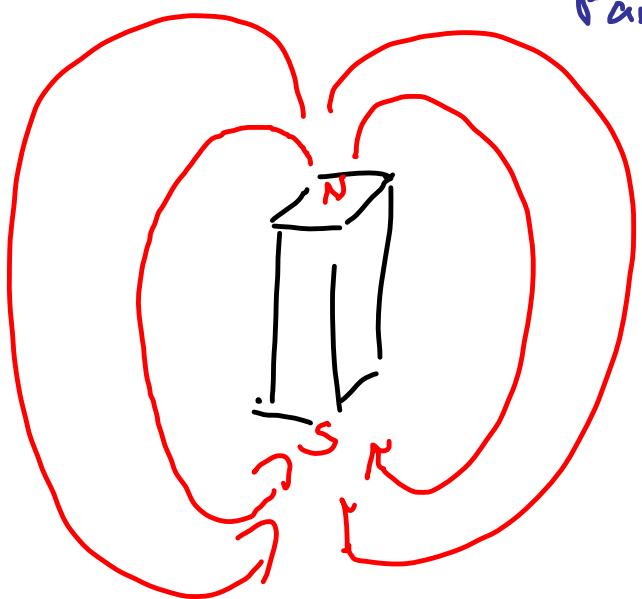

"If this nonsense from Bohr will  
prove to be right we will quit physics."  
(Stern vowed in 1913)

as quoted in Phys. Today Dec 03

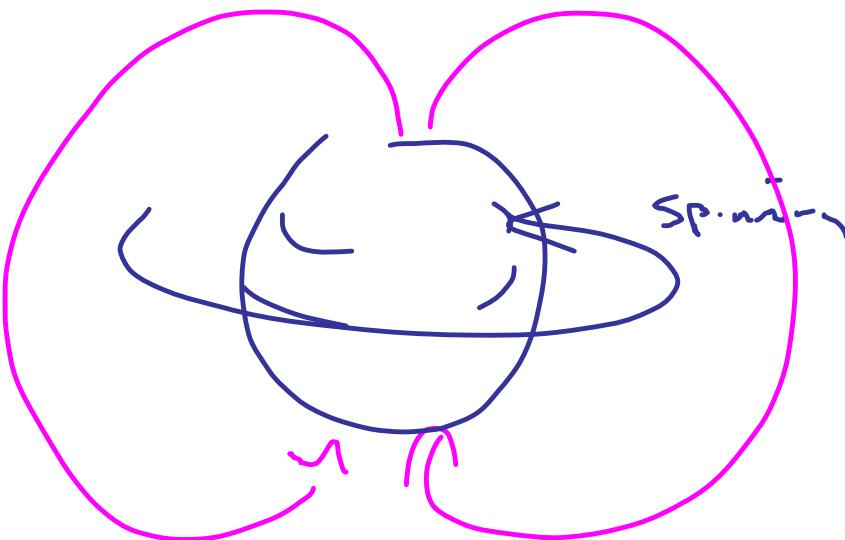

Walther Gerlach

from phys Today article  
(Dec. 03)

Particles have Spin

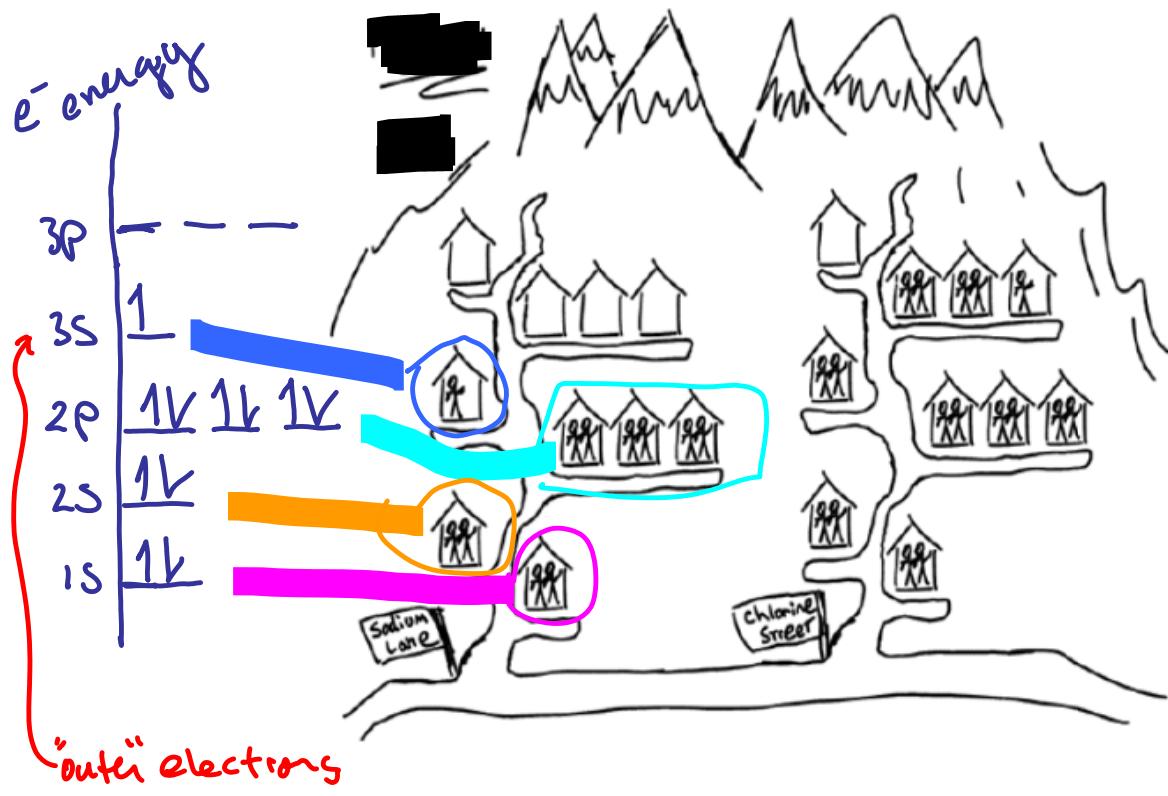

$Z$ ,  $W$   
Higgs  
photon  $\gamma$

Spin is quantized  
 $0, \frac{1}{2}, 1, \frac{3}{2}, 2 \dots$

Integer Spin  $\rightarrow$  Bosons  
Bose-Einstein  
STATISTICS

half-integer Spin  $\rightarrow$  Fermions

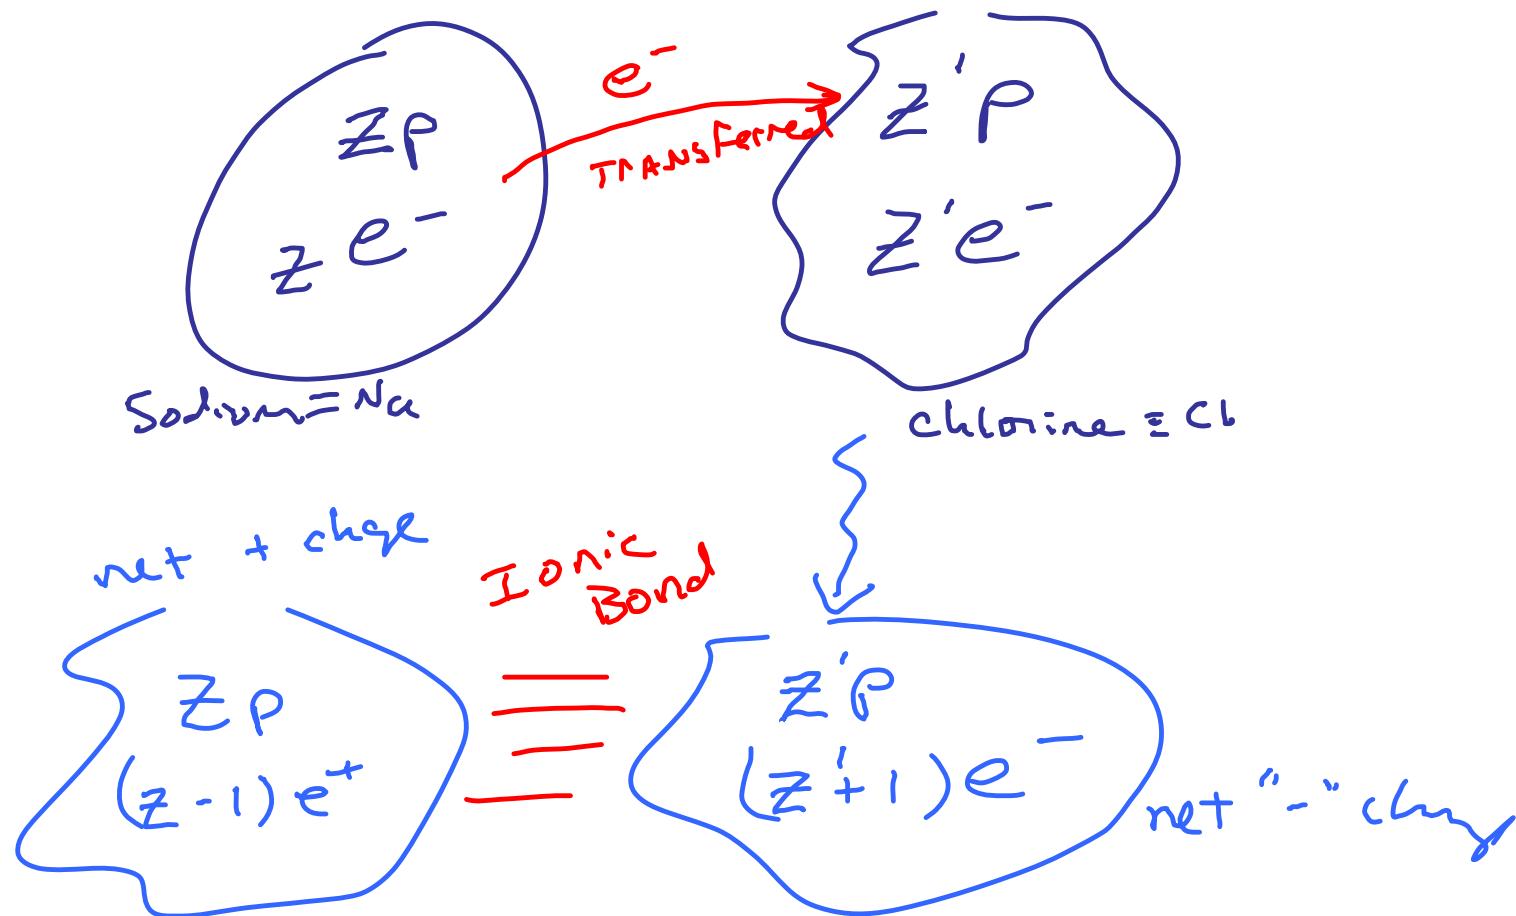

$e$ , proton, neutron

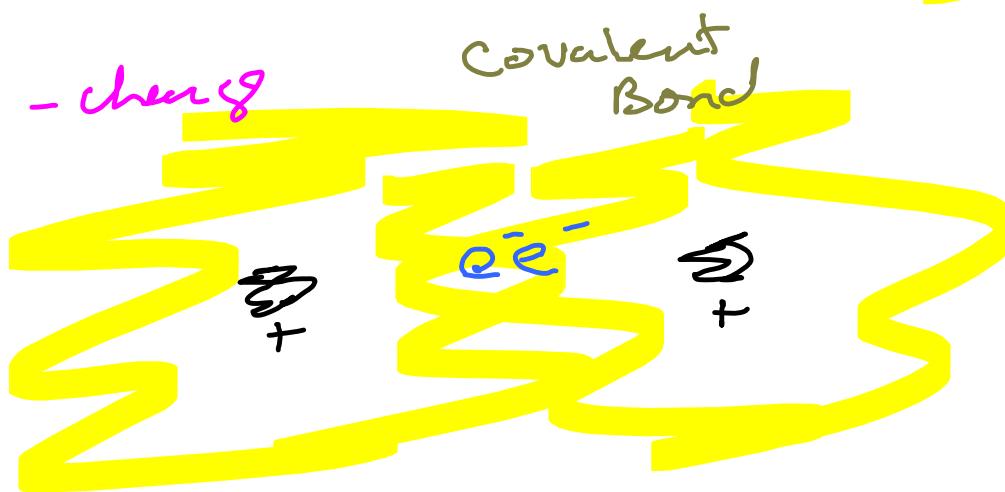

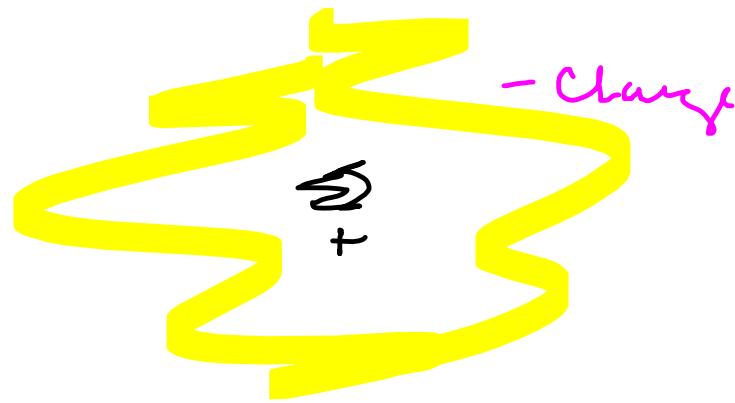

"outer" electrons

most important

in determining size + chemical characteristics  
of atom

Very reactive in this column

## Los Alamos National Laboratory Chemistry Division

Very inert  
in this  
column
