Special Relativity

1) Speed of light is constant in all inertial frames of reference
2) Physical laws must look the same in all inertial frames of refence - there is no experiment that can determine the "absolute" velocity of any inertial frame

$\Rightarrow$ If a flash of light goes off at the origin of some coord system, the outgoing wavefronts look spherical in all inertial frames.

Equation of wavefront is $\quad r^2 - c^2t^2 = 0$

$\Rightarrow$ (x, y, z, t) coords in one inertial frame K

(x', y', z', t') coords in another inertial frame K' that moves with velocity $\vec{v} = v\hat{x}$ with respect to K.

What is the transformation that relates coords in K' to coords in K

$$y = y', \quad z = z'$$

$$\Rightarrow \quad c^2t^2 - x^2 = c^2t'^2 - x'^2$$

$$\Rightarrow \quad \frac{(ct+x)}{(ct'+x')}\frac{(ct-x)}{(ct'-x')} = 1$$

Expect transformation to be linear

$$\Rightarrow \quad ct' + x' = (ct+x)\, f$$
$$ct' - x' = (ct-x)\, f^{-1}$$

for some constant f. $\quad$ write $f = e^{-y}$ $\quad$ y is rapidity

Solve for ct' and x' in terms of ct and x

$$ct' = ct\left(\frac{e^y + e^{-y}}{2}\right) - x\left(\frac{e^y - e^{-y}}{2}\right)$$

$$x' = -ct\left(\frac{e^y - e^{-y}}{2}\right) + x\left(\frac{e^y + e^{-y}}{2}\right)$$

$$ct' = ct \cosh y - x \sinh y$$
$$x' = -ct \sinh y + x \cosh y$$

<u>meaning of ~~pcor~~ parameter y</u>

the origin of K (at $x=0$) has trajectory $x' = -vt'$ in K'

$$\Rightarrow \quad \frac{x'}{t'} = -v$$

from transformation above, with $x=0$, we get

$$\frac{x'}{ct'} = \frac{-ct \sinh y}{ct \cosh y} = -\tanh y$$

so $\quad \frac{v}{c} = \tanh y$

$$\Rightarrow \quad \cosh y = \frac{1}{\sqrt{1-\left(\frac{v}{c}\right)^2}} \equiv \gamma$$

$$\sinh y = \left(\frac{v}{c}\right)\gamma$$

<u>Lorentz Transformation</u>
$$\begin{cases} ct' = \gamma ct - \gamma\left(\frac{v}{c}\right)x \\ x' = -\gamma\left(\frac{v}{c}\right)ct + \gamma x \end{cases}$$

Inverse transform obtained by taking $v \to -v$ in above

$$\begin{cases} ct = \gamma ct' + \gamma\left(\frac{v}{c}\right) x' \\ x = \gamma\left(\frac{v}{c}\right) ct' + \gamma x' \end{cases}$$

4 - vectors

4-position: $x_\mu = (x_1, x_2, x_3, i\;)$ $\qquad x_4 \equiv it$

$$x_\mu x_\mu \equiv \sum_{\mu=1}^{4} x_\mu^2 = r^2 - c^2t^2$$

Lorentz invariant scalar – has same value in all interial frames

Lorentz transf is

$$\left.\begin{aligned} x_1' &= \gamma\left(x_1 + i\left(\tfrac{v}{c}\right)x_4\right) \\ x_2' &= x_2 \\ x_3' &= x_3 \\ x_4' &= \gamma\left(x_4 - i\left(\tfrac{v}{c}\right)x_1\right) \end{aligned}\right\}$$

linear transf, can be represented by a matrix

or $\quad x_\mu' = a_{\mu\nu}(L)\, x_\nu$

$\uparrow$ matrix of Lorentz transformation L

$$a(L) = \begin{pmatrix} \gamma & 0 & 0 & i\frac{v}{c}\gamma \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ -i\frac{v}{c}\gamma & 0 & 0 & \gamma \end{pmatrix}$$

inverse: $\quad x_\mu = a_{\mu\nu}(L^{-1})\, x_\nu'$

$a_{\mu\nu}(L^{-1})$ is given by taking $v \to -v$ in $a_{\mu\nu}(L)$

we see $\quad a_{\mu\nu}(L^{-1}) = a_{\nu\mu}(L)$

inverse = transpose

More generally

Since x_μ^2 is Lorentz invariant scalar,

$$x_\mu'^2 = a_{\mu\nu}(L)\, a_{\mu\lambda}(L)\, x_\nu x_\lambda = x_\lambda^2$$

$$\Rightarrow a_{\mu\nu}(L)\, a_{\mu\lambda}(L) = \delta_{\nu\lambda}$$

$$\Rightarrow a^t_{\nu\mu}(L)\, a_{\mu\lambda}(L) = \delta_{\nu\lambda}$$

$$\Rightarrow a^t_{\mu\nu} = a^{-1}_{\mu\nu}(L)$$ transpose = inverse

$a_{\mu\nu}$ is 4x4 orthogonal matrix

If L_1 is a Lorentz transf from K to K'

L_2 is a Lorentz transf from K' to K''

Then the Lorentz transf from K to K'' is given by the matrix

$$a(L_2 L_1) = a(L_2)\, a(L_1)$$

$$\Rightarrow a^{-1}(L) = a(L^{-1})$$

$$dx_\mu = (dx_1, dx_2, dx_3, ic\,dt)$$

$$-(dx_\mu)^2 \equiv c^2 ds^2 = c^2 dt^2 - dr^2$$ Lorentz invariant scalar

$$ds^2 = dt^2\left[1 - \frac{1}{c^2}\left(\frac{dx_1}{dt}\right)^2 - \frac{1}{c^2}\left(\frac{dx_2}{dt}\right)^2 - \frac{1}{c^2}\left(\frac{dx_3}{dt}\right)^2\right]$$

$$ds^2 = \frac{dt^2}{\gamma^2}$$

$$\boxed{ds = \frac{dt}{\gamma}}$$ proper time interval

A 4-vector is any 4 numbers that transform under a Lorentz transformation the same way as does x_μ

<u>4-velocity</u> $\quad u_\mu \equiv \dfrac{dx_\mu}{ds} \equiv \dot{x}_\mu$

$$= \gamma \frac{dx_\mu}{dt}$$

space components $\vec{u} = \gamma \vec{v}$

$$u_4 = ic\gamma$$

$$u_\mu u_\mu = \gamma^2 v^2 - c^2\gamma^2 = \gamma^2(v^2 - c^2)$$

$$= \frac{v^2 - c^2}{1 - \frac{v^2}{c^2}} = -c^2$$

<u>4-acceleration</u> $\quad a_\mu \equiv \dfrac{du_\mu}{ds} = \gamma \dfrac{du_\mu}{dt}$

<u>4-gradient</u> $\quad \dfrac{\partial}{\partial x_\mu} \equiv \left(\vec{\nabla}, \dfrac{-i}{c}\dfrac{\partial}{\partial t}\right)$

proof $\dfrac{\partial}{\partial x_\mu}$ is a 4-vector

$$\frac{\partial}{\partial x_\mu'} = \frac{\partial x_\lambda}{\partial x_\mu'} \frac{\partial}{\partial x_\lambda} \qquad \text{but } \frac{\partial x_\lambda}{\partial x_\mu'} = a_{\lambda\mu}(L^{-1}) = a_{\mu\lambda}(L)$$

$$= a_{\mu\lambda}(L) \frac{\partial}{\partial x_\lambda}$$

so transforms same as x_μ

$$\left(\frac{\partial}{\partial x_\mu}\right)^2 = \nabla^2 - \frac{1}{c^2}\frac{\partial^2}{\partial t^2} \qquad \text{wave equation operator!}$$

<u>inner products</u>

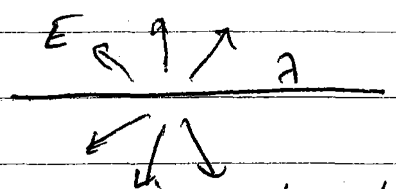
If U_μ and V_μ are 4-vectors, then $U_\mu V_\mu$ is Lorentz invariant scalar

Electromagnetism

Clearly $\vec{E}$ + $\vec{B}$ must transform into each other under Lorentz transf.

in inertial frame K

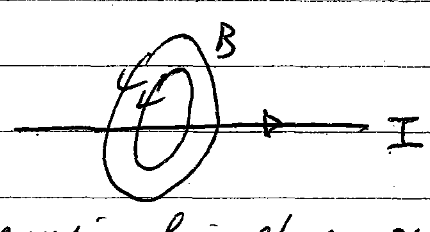
stationary line charge λ



cylindrical outward electric field

no B-field

in frame K' moving with $\vec{v}$ // to wire



moving line charge gives current $\Rightarrow$ B circulating around wire as well as outward radial E

Lorentz force

$$\vec{F} = q\vec{E} + q\frac{\vec{v}}{c}\times\vec{B}$$

What is the velocity $\vec{v}$ here? velocity with respect to what inertial frame? clearly $\vec{E}$ and $\vec{B}$ must change from one inertial frame to another if this force law can make sense.

Charge density

Consider charge ΔQ contained in a vol ΔV.
ΔQ is a Lorentz invariant scalar.

Consider the reference frame in which the charge is instantaneously at rest. In this frame

$\Delta Q = \mathring{\rho}\, \delta \mathring{V}$ $\quad$ $\mathring{\rho}$ is charge density in the rest frame

$\Delta \mathring{V}$ is volume in the rest frame

$\mathring{\rho}$ is Lorentz invariant by definition

Now transform to another frame moving with $\vec{v}$ with respect to rest frame

ΔQ remains the same

$$\Delta V = \frac{\Delta \mathring{V}}{\gamma} \quad \text{volume contracts in direction } \parallel \text{ to } \vec{v}$$

$$\rho = \frac{\Delta Q}{\Delta V} = \frac{\Delta Q}{\Delta \mathring{V}}\gamma = \mathring{\rho}\gamma$$

Current density is $\vec{j} = \rho \vec{v} = \gamma \vec{v} \cdot \frac{\rho}{\gamma} = \mathring{\rho}\, \vec{u}$

Define 4-current $\boxed{j_\mu = (\vec{j}, ic\rho)} = \mathring{\rho}(\vec{u} \quad ic\gamma)$
$= \mathring{\rho}\, u_\mu$

It is 4-vector since u_μ is 4-vector and $\mathring{\rho}$ is Lorentz invariant scalar.

charge conservation

$$\vec{\nabla} \cdot \vec{j} + \frac{\partial \rho}{\partial t} = \boxed{\frac{\partial j_\mu}{\partial x_\mu} = 0}$$

Equation for potentials in Lorentz gauge

$$\left(\nabla^2 - \frac{1}{c^2}\frac{\partial^2}{\partial t^2}\right)\vec{A} = -\frac{4\pi}{c}\vec{j}$$

$$\left(\nabla^2 - \frac{1}{c^2}\frac{\partial^2}{\partial t^2}\right)\phi = -4\pi\rho$$

$$\frac{\partial^2}{\partial x_\mu^2} = \left(\nabla^2 - \frac{1}{c^2}\frac{\partial^2}{\partial t^2}\right) \text{ is Lorentz invariant operator}$$

4-potential $\boxed{A_\mu = (\vec{A}, \ i\phi)}$

$$\left(\nabla^2 - \frac{1}{c^2}\frac{\partial^2}{\partial t^2}\right)A_\mu = \boxed{-\frac{4\pi}{c} j_\mu = \frac{\partial^2 A_\mu}{\partial x_\mu^2}}$$

Lorentz gauge condition is

$$\vec{\nabla}\cdot\vec{A} + \frac{\partial\phi}{c\,\partial t} = \frac{\partial A_\mu}{\partial x_\mu} = 0$$

Electric and magnetic fields

$$B_i = \frac{\partial A_k}{\partial x_j} - \frac{\partial A_j}{\partial x_k} \qquad i, j, k \text{ cyclic permutation of } 1, 2, 3$$

$$E_i = -\frac{\partial\phi}{\partial x_i} - \frac{\partial A_i}{c\,\partial t} = i\left(\frac{\partial A_4}{\partial x_i} - \frac{\partial A_i}{\partial x_4}\right)$$

Define field stress tensor

$$\boxed{F_{\mu\nu} = \frac{\partial A_\nu}{\partial x_\mu} - \frac{\partial A_\mu}{\partial x_\nu} = -F_{\nu\mu}}$$

$$= \begin{pmatrix} 0 & B_3 & -B_2 & -iE_1 \\ -B_3 & 0 & B_1 & -iE_2 \\ B_2 & -B_1 & 0 & -iE_3 \\ iE_1 & iE_2 & iE_3 & 0 \end{pmatrix}$$

"curl" of a 4-vector is a 4x4 anti symmetric 2nd rank tensor

Inhomogeneous Maxwell's equations can be written in the form

$$\boxed{\frac{\partial F_{\mu\nu}}{\partial x_\nu} = \frac{4\pi}{c} j_\mu} \Rightarrow \left[\begin{array}{l} \vec{\nabla}\cdot\vec{E} = 4\pi\rho \\ \vec{\nabla}\times\vec{B} - \frac{1}{c}\frac{\partial \vec{E}}{\partial t} = \frac{4\pi}{c}\vec{j} \end{array} \right]$$

$$= \frac{\partial}{\partial x_\nu}\left(\frac{\partial A_\nu}{\partial x_\mu} - \frac{\partial A_\mu}{\partial x_\nu} \right) = \frac{\partial}{\partial x_\mu}\underbrace{\left(\frac{\partial A_\nu}{\partial x_\nu} \right)}_{=0} - \frac{\partial^2 A_\mu}{\partial x_\nu^2}$$

$$\Rightarrow -\frac{\partial^2 A_\mu}{\partial x_\nu^2} = \frac{4\pi}{c} j_\mu$$ agrees with previous equation for A_μ

transformation law for 2nd rank tensor $F_{\mu\nu}$

$$F'_{\mu\nu} = \frac{\partial A'_\nu}{\partial x'_\mu} - \frac{\partial A'_\mu}{\partial x'_\nu}$$

use $A'_\mu = a_{\mu\sigma} A_\sigma$

$$\frac{\partial}{\partial x'_\mu} = a_{\mu\lambda}\frac{\partial}{\partial x_\lambda}$$

$$= a_{\nu\lambda} a_{\mu\sigma} \frac{\partial A_\lambda}{\partial x_\sigma}$$

$$- a_{\mu\sigma} a_{\nu\lambda} \frac{\partial A_\sigma}{\partial x_\lambda}$$

$$F'_{\mu\nu} = a_{\mu\sigma} a_{\nu\lambda} F_{\sigma\lambda}$$

lets one find $\vec{E}'$ and $\vec{B}'$ if one knows $\vec{E}$ and $\vec{B}$

For n^{th} rank tensor

$$T'_{\mu_1\mu_2\cdots\mu_n} = a_{\mu_1\nu_1} a_{\mu_2\nu_2} \cdots a_{\mu_n\nu_n} T_{\nu_1\nu_2\cdots\nu_n}$$

$\frac{\partial F_{\mu\nu}}{\partial x_\nu}$ is a 4-vector: proof:

$$\frac{\partial F'_{\mu\nu}}{\partial x'_\nu} = a_{\mu\sigma}\, a_{\nu\lambda}\, a_{\nu\gamma}\, \frac{\partial F_{\sigma\lambda}}{\partial x_\gamma}$$

but $a_{\nu\lambda} = a^{-1}_{\lambda\nu}$ since inverse = transpose

$$a_{\nu\lambda}\, a_{\nu\gamma} = a^{-1}_{\lambda\nu}\, a_{\nu\gamma} = \delta_{\lambda\gamma}$$

$$\frac{\partial F'_{\mu\nu}}{\partial x'_\nu} = a_{\mu\sigma} \frac{\partial F_{\sigma\lambda}}{\partial x_\gamma} \delta_{\lambda\gamma} = a_{\mu\sigma} \frac{\partial F_{\sigma\lambda}}{\partial x_\lambda}$$ transforms like 4-vector

To write the <u>homogeneous Maxwell Equations</u>

Construct 3rd rank co-variant tensor

$$\boxed{G_{\mu\nu\lambda} = \frac{\partial F_{\mu\nu}}{\partial x_\lambda} + \frac{\partial F_{\lambda\mu}}{\partial x_\nu} + \frac{\partial F_{\nu\lambda}}{\partial x_\mu}}$$

transforms as $G'_{\mu\nu\lambda} = a_{\mu\alpha}\, a_{\nu\beta}\, a_{\lambda\gamma}\, G_{\alpha\beta\gamma}$

in principle G has $4^3 = 64$ components

But can show that G is antisymmetric in exchange of any two indices

$$G_{\nu\mu\lambda} = \frac{\partial F_{\nu\mu}}{\partial x_\lambda} + \frac{\partial F_{\lambda\nu}}{\partial x_\mu} + \frac{\partial F_{\mu\lambda}}{\partial x_\nu}$$

$$= -\frac{\partial F_{\mu\nu}}{\partial x_\lambda} - \frac{\partial F_{\nu\lambda}}{\partial x_\mu} - \frac{\partial F_{\lambda\mu}}{\partial x_\nu}$$ as F antisymmetric

$$= -G_{\nu\mu\lambda}$$

Also $G_{\mu\nu\lambda} = 0$ if any two indices are equal

$\Rightarrow$ only 4 independent components

$$G_{012}, \quad G_{013}, \quad G_{023}, \quad G_{123}$$

all other components either vanish or are $\pm$ one of the above.

The 4 homogeneous Maxwell Equations:

$$\vec{\nabla}\cdot\vec{B} = 0, \quad \vec{\nabla}\times\vec{E} + \frac{1}{c}\frac{\partial\vec{B}}{\partial t} = 0$$

can be written as

$$\boxed{G_{\mu\nu\lambda} = 0}$$

to see, substitute in definition of G the definition of F.

$$G_{\mu\nu\lambda} = \frac{\partial^2 A_\nu}{\partial x_\lambda \partial x_\mu} - \frac{\partial^2 A_\mu}{\partial x_\lambda \partial x_\nu} + \frac{\partial^2 A_\mu}{\partial x_\nu \partial x_\lambda} - \frac{\partial^2 A_\lambda}{\partial x_\nu \partial x_\mu} + \frac{\partial^2 A_\lambda}{\partial x_\mu \partial x_\nu} - \frac{\partial^2 A_\nu}{\partial x_\mu \partial x_\lambda}$$

all terms cancel in pairs

$= 0$

$G_{123} = 0 \Rightarrow \vec{\nabla}\cdot\vec{B} = 0$

$G_{012} = -i\left[\vec{\nabla}\times\vec{E} + \frac{\partial\vec{B}}{c\,\partial t}\right]_z = 0$ z component Faraday's law

Another way to write homogeneous Maxwell Equations

Define $\epsilon_{\mu\nu\lambda\sigma} = \begin{cases} +1 & \text{if } \mu\nu\lambda\sigma \text{ is even permutation of } 1234 \\ -1 & \text{if } \mu\nu\lambda\sigma \text{ is odd permutation of } 1234 \\ 0 & \text{otherwise} \end{cases}$

4-d Levi Civita symbol

Define

$$\tilde{F}_{\mu\nu} = \frac{1}{2i} \epsilon_{\mu\nu\lambda\sigma} F_{\lambda\sigma}$$

pseudo-tensor

has wrong sign under parity transf

$$= \begin{pmatrix} 0 & -E_3 & E_2 & -iB_1 \\ E_3 & 0 & -E_1 & -iB_2 \\ -E_2 & E_1 & 0 & -iB_3 \\ iB_1 & iB_2 & iB_3 & 0 \end{pmatrix}$$

$\dfrac{\partial \tilde{F}_{\mu\nu}}{\partial x_\nu} = 0$ gives homogeneous Maxwell equations

$$\left.\begin{aligned} \tfrac{1}{2} F_{\mu\nu} F_{\mu\nu} &= B^2 - E^2 \\ -\tfrac{1}{4} F_{\mu\nu} \tilde{F}_{\mu\nu} &= \vec{B} \cdot \vec{E} \end{aligned}\right\} \text{Lorentz invariant scalars}$$

From $F'_{\mu\nu} = a_{\mu\sigma} a_{\nu\lambda} F_{\sigma\lambda}$ we can get Lorentz transf for $\vec{E}$ and $\vec{B}$

For a transformation from K to K' with K' moving with v along x, with respect to K,

$$E_1' = E_1 \qquad\qquad B_1' = B_1$$
$$E_2' = \gamma\left(E_2 - \frac{v}{c} B_3\right) \qquad\qquad B_2' = \gamma\left(B_2 + \frac{v}{c} E_3\right)$$
$$E_3' = \gamma\left(E_3 + \frac{v}{c} B_2\right) \qquad\qquad B_3' = \gamma\left(B_3 - \frac{v}{c} E_2\right)$$

<u>Kinematics</u>

"dot" is $\frac{d}{ds}$

<u>4-momentum</u> $\quad p_\mu = m\dot{x}_\mu = m u_\mu = (m\gamma\vec{v},\ i m c\gamma)$

$$p_\mu^2 = m^2 u_\mu^2 = -m^2c^2$$

<u>4-force</u> $\quad K_\mu = (\vec{K},\ iK_0)$ "Minkowski force"

Newton's 2nd law

$$m\frac{d^2 x_\mu}{ds^2} = K_\mu$$

$$\Rightarrow m\frac{du_\mu}{ds} = \frac{dp_\mu}{ds} = K_\mu$$

$$p_\mu^2 = -m^2c^2 \Rightarrow \frac{d}{ds}\left(p_\mu^2\right) = p_\mu \frac{dp_\mu}{ds} = p_\mu K_\mu = 0$$

$$\Rightarrow m\gamma\vec{v}\cdot\vec{K} - mc\gamma K_0 = 0 \qquad \text{or}$$

$$K_0 = \frac{\vec{v}}{c}\cdot\vec{K}$$

Define the usual 3-force by

$$\frac{d\vec{p}}{dt} = \vec{F}$$

$$\frac{d\vec{p}}{ds} = \vec{K} \text{ and } \frac{d\vec{p}}{ds} = \gamma \frac{d\vec{p}}{dt} = \gamma\vec{F} \quad \Rightarrow \quad \begin{array}{l} \vec{K} = \gamma\vec{F} \\ K_0 = \gamma \frac{\vec{v}}{c}\cdot\vec{F} \end{array}$$

Consider 4^{th}-component of Newton's eqn

$$m\frac{d}{ds}u_4 = m\frac{d}{ds}(ic\gamma) = iK_0 = i\gamma\frac{\vec{v}}{c}\cdot\vec{F}$$

$$d(m\gamma) = \gamma\frac{\vec{v}}{c^2}\cdot\vec{F}\,ds = \frac{dt}{c^2}\,\vec{v}\cdot\vec{F} = \frac{d\vec{r}\cdot\vec{F}}{c^2}$$

Work-energy theorem: $d(m\gamma c^2) = d\vec{r}\cdot\vec{F}$ = work done

$\Rightarrow$ $d(m\gamma c^2)$ is change in kinetic energy

$E = m\gamma c^2$ is relativistic kinetic energy

$$\boxed{p_\mu = \left(\vec{p}, \frac{iE}{c}\right) \qquad \begin{array}{l} \vec{p} = m\gamma\vec{v} \\ E = m\gamma c^2 \end{array}}$$

$$E = \frac{mc^2}{\sqrt{1-\frac{v^2}{c^2}}} \approx mc^2\left(1 + \frac{1}{2}\frac{v^2}{c^2}\right) = mc^2 + \frac{1}{2}mv^2$$

small $\frac{v}{c}$ — restmass energy — non-rel kinetic energy

$\frac{dp_\mu}{ds} = K_\mu$ is therefore relativistic analog of Newton's 3rd law as well as law of conservation of energy

Lorentz force

$$\frac{dp_\mu}{ds} = K_\mu$$

what is the K_μ that represents the Lorentz force and how can we write it in ~~relativis~~ Lorentz covariant way?

K_μ should depend on the fields $F_{\mu\nu}$ and the particles trajectory x_μ

as $\vec{v} \to 0$ $\vec{K} = q\vec{E}$

K_μ cant depend directly on x_μ as should be indep of origin of coords. So can depend only on $\overset{\circ}{x}_\mu$, $\overset{\circ\circ}{x}_\mu$, etc.

as $v \to 0$, K does not depend on the acceleration, so K does not depend on $\overset{\circ\circ}{x}_\mu$

K_μ only depends on $F_{\mu\nu}$ and $\overset{\circ}{x}_\mu$
we need to form a 4-vector out of $F_{\mu\nu}$ and $\dot{x}_\mu$ that is linear in the fields $F_{\mu\nu}$ and proportional to the charge q.

The only possibility is

$$q\, f(\overset{\circ}{x}_\mu^{\,2})\, F_{\mu\nu}\, \overset{\circ}{x}_\nu$$

But $\mathring{x}_\mu^2 = c^2$ is a constant. Choose $f(x_\mu^2) = \frac{1}{c}$

$$K_\mu = \frac{q}{c} F_{\mu\nu} \mathring{x}_\nu \quad \text{is only possibility}$$

This gives force

$$\vec{F} = \frac{1}{\gamma} \vec{K}$$

$$F_i = \frac{1}{\gamma} K_i = \frac{q}{\gamma c}\left(F_{ij} \mathring{x}_j + F_{i4} \mathring{x}_4\right)$$

$$= \frac{q}{\gamma c}\left(\frac{\partial A_j}{\partial x_i} - \frac{\partial A_i}{\partial x_j}\right) \mathring{x}_j + \frac{q}{\gamma c}(-iE_i)(ic\gamma)$$

$$= \frac{q}{\gamma c}\left[\varepsilon_{ijk} B_k \gamma v_j\right] + \frac{q}{\gamma c} E_i c \gamma$$

$$= q E_i + q \varepsilon_{ijk} \frac{v_j}{c} B_k$$

$$\vec{F} = q\vec{E} + q\frac{\vec{v}}{c} \times \vec{B}$$

Lorentz force is the same form in all inertial frames. No relativistic modification is needed.

Relativistic Larmor's formula

non-relativistic $\mathcal{P} = \frac{2}{3} \frac{q^2 [a(t_0)]^2}{c^3}$

Consider inertial frame in which charge is instantaneously at rest. Call this rest frame $\mathring{K}$.

power radiated in $\mathring{K}$ is $\mathring{\mathcal{P}} = \frac{d\mathring{\mathcal{E}}(\mathring{t})}{d\mathring{t}}$

where $\mathring{\mathcal{E}}$ is energy radiated. In $\mathring{K}$, the momentum density $\vec{\mathring{\Pi}} = \frac{1}{4\pi c} \vec{\mathring{E}} \times \vec{\mathring{B}} \sim \hat{\mathring{r}}$ is in outward radial direction. Integrating over all directions, the radiated momentum vanishes $\mathring{p} = 0$

energy-momentum is a 4-vector $(\vec{\mathring{p}}, \frac{i}{c}\mathring{\mathcal{E}})$

To get radiated energy in original frame K we can use Lorentz transf

$$\frac{\mathcal{E}}{c} = \gamma\left(\frac{\mathring{\mathcal{E}}}{c} - \frac{\vec{v}}{c}\cdot\vec{\mathring{p}}\right) \Rightarrow \mathcal{E} = \gamma\mathring{\mathcal{E}} \quad \text{as } \vec{\mathring{p}} = 0$$

and $dt = \gamma\, d\mathring{t}$ is time interval in K

($d\vec{\mathring{r}} = 0$ as charge stays at origin in $\mathring{K}$)

So $\frac{d\mathcal{E}}{dt} = \frac{\gamma d\mathring{\mathcal{E}}}{\gamma d\mathring{t}} = \frac{d\mathring{\mathcal{E}}}{d\mathring{t}} \Rightarrow \mathcal{P} = \mathring{\mathcal{P}}$

radiated power is Lorentz invariant!

in $\overset{\circ}{K}$ we can use non-relativistic Larmor's formula since $v=0$. So

$$P = \frac{2}{3}\frac{q\,\overset{\circ}{a}^2}{c^3} \qquad \overset{\circ}{a} \text{ is acceleration in } \overset{\circ}{K}$$

To write an expression without explicitly making mention of frame $\overset{\circ}{K}$, we need to find a Lorentz invariant scalar that reduces to a^2 as $v \to 0$.
Only choice is α_μ^2 the 4-acceleration $\alpha_\mu = \frac{du_\mu}{ds}$

$$\alpha_\mu = \frac{du_\mu}{ds} = \gamma\frac{du_\mu}{dt} = \gamma\frac{d}{dt}\left(\gamma\vec{v},\ ic\gamma\right)$$

$$\vec{\alpha} = \gamma^2\frac{d\vec{v}}{dt} + \gamma\vec{v}\frac{d\gamma}{dt}$$

$$\alpha_4 = ic\gamma\frac{d\gamma}{dt}$$

$$\frac{d\gamma}{dt} = \frac{d}{dt}\left(\frac{1}{\sqrt{1-v^2/c^2}}\right) = \frac{\frac{\vec{v}}{c^2}\cdot\frac{d\vec{v}}{dt}}{(1-v^2/c^2)^{3/2}} = \frac{1}{c^2}\gamma^3\,\vec{v}\cdot\vec{a}$$

as $\vec{v}\to 0$, $\gamma \to 1$, $\frac{d\gamma}{dt}\to 0$, so $\begin{cases}\vec{\alpha} \to \frac{d\vec{v}}{dt} = \vec{a} \\ \alpha_4 \to 0\end{cases}$

$\alpha_\mu^2 \to |\vec{a}|^2$ as desired

Relativistic Larmor's formula

$$P = \frac{2}{3}\frac{q}{c^3}\alpha_\mu^2 = \frac{2}{3}\frac{q}{c^3}\left(\dot{u}_\mu\right)^2$$

$$\alpha_\mu = \left(\gamma^2 \frac{d\vec{v}}{dt} + \gamma \vec{v} \frac{d\gamma}{dt} , i c \gamma \frac{d\gamma}{dt} \right)$$

$$\frac{d\gamma}{dt} = \frac{1}{c^2} \gamma^3 \vec{v} \cdot \vec{a}$$

$$\alpha_\mu = \left(\gamma^2 \vec{a} + \gamma^4 \frac{1}{c^2} (\vec{v} \cdot \vec{a}) \vec{v} , \frac{i c \gamma^4 \vec{v} \cdot \vec{a}}{c^2} \right)$$

$$\alpha_\mu^2 = \gamma^4 a^2 + \gamma^8 \frac{(\vec{v}\cdot\vec{a})^2 v^2}{c^4} + \frac{2\gamma^6}{c^2} (\vec{v}\cdot\vec{a})^2 - \frac{\gamma^8 (\vec{v}\cdot\vec{a})^2}{c^2}$$

$$= \gamma^4 \left[a^2 + \gamma^4 \frac{(\vec{v}\cdot\vec{a})^2}{c^2} \left(\frac{v^2}{c^2} - 1 \right) + \frac{2\gamma}{c^2} (\vec{v}\cdot\vec{a})^2 \right]$$

$$= \gamma^4 \left\{ a^2 - \gamma^2 \frac{(\vec{v}\cdot\vec{a})^2}{c^2} + \frac{2\gamma^2 (\vec{v}\cdot\vec{a})^2}{c^2} \right\}$$

$$\alpha_\mu^2 = \gamma^4 \left[a^2 + \gamma^2 \frac{(\vec{v}\cdot\vec{a})^2}{c^2} \right]$$

as $\vec{v} \to 0$, $\alpha_\mu^2 \to a^2$

$\alpha_\mu^2 = \mathring{a}^2$ Lorentz invariant

$\mathring{a}$ = acceleration in instantaneous rest frame

For a charge accelerating in linear motion, ~~which~~ $(\vec{v}\cdot\vec{a})^2 = v^2 a^2$

$$\alpha_\mu^2 = \gamma^4 a^2 \left(1 + \gamma^2 \frac{v^2}{c^2} \right) = \gamma^6 a^2$$

$$P = \frac{2 a^2}{3 c^3} \gamma^6$$

For a charge in circular motion $(\vec{v}\cdot\vec{a}) = 0$

$$\alpha_\mu^2 = \gamma^4 a^2$$

$$P = \frac{2}{3} \frac{a^2}{c^3} \gamma^4$$
