Final Exam (December 18, 2012)

Please read the problems carefully and answer them in the space provided. Write on the back of the page, if necessary. Show all your work. Partial credit will be given unless specified otherwise.

Problem 1 (12 pts, show-your stroke):

Below you will find six sketches along with a request to specify the direction of something. For each part, indicate the direction of the quantity as requested. Choose from the directions (as you look at your paper): to the right, to the left, up toward the top of the paper, down toward the bottom of the paper, into the paper, out of the paper.

E = 18 seconds

Problem 2 (10 pts, show your work):

After finishing final exams, Billy Ray Eastman takes his sweetheart, Emma Mae Lattimore, out on the Genesee River for a ride in his new motor boat. Emma Mae is looking fine with the wind blowing through her long, lovely hair and Billy Ray's intentions are <u>not</u> good. But, for more of that part of the story, you'll have to take Human Sexuality 101 in the Psychology Department. Here we are more concerned with how Billy Ray and Emma Mae and the boat get from one place to another. And, of course, we are going to ignore the wind resistance of Emma Mae's hair in our calculations.

Billy Ray attempts to cross the Genesee by pointing his boat directly west toward the other shore. The river at this point flows north with a speed of 2 m/s. Billy Ray determines that his boat is moving at 3 mo

How fast is Billy Ray's boat moving in a westerly direction?

How long will it take Billy Ray to cross the river if it is 100 meters wide at the point where he crosses?

Problem 3 (10 pts):

Two identical masses are attached to three identical strings as shown in the sketch to the right. The top string is attached to the ceiling and the bottom string is attached to the floor. The strings are taut. A bar moves slowly from right to left through the room and encounters the mid-point of the middle string. The bar keeps moving slowly to the left until one of the strings breaks. Which string breaks (top, middle, or bottom)? Briefly defend your answer with text and/or sketches.

String I breaks. The tension in String I String II is the greatest since it must support the weight of the other two masses plus the additional tension in the string caused by the Passing of the bar through the string

Problem 4 (8 pts, defend your choice):

Although it isn't widely known, 2012 is considered Elfen Spring in some quarters. This year "Santa's Elves" and the Abominable Snowman have joined forces to fight for their freedom from the oppressive regime of the evil Kris Kringle.

Below is a sketch of the elf separatist, Hermey the Sneaky, as he carries a small, guided anti-aircraft missile across the ice in hopes that he can use it to take out Santa's sleigh on Christmas Eve. Hermey's missile is enclosed in the case that he is shown carrying. The missile contains a spinning wheel as part of the guidance system. The wheel spins with an angular velocity, $\boldsymbol{\omega}$, oriented in a northerly direction as shown in the sketch. If Hermey turns west, the front end of the case containing the missile

ney Tuning weat means s on uptract torque on the case. I and I is along is the front of the

(a) Lifts upward

- b) Dips down
- c) Does nothing whatever unusual
- d) Pulls to the east

Briefly defend your choice.

Problem 5 (10 pts, show your work):

If you want to impress your family over Christmas break, you can place a golf ball on top of a basketball and drop the pair simultaneously from rest. (I think this is not something you should try indoors ... otherwise you may find it will impress your parents in a way that you might rather avoid!) When the basketball hits the ground, the golf ball pops high into the air. Briefly explain why this happens through text, equations, and/or sketches.

why this happens through text, equations, and/or sketches.

Problem 7 (6 pts, no partial credit):

Consider the waves moving on a string as shown in the sketch below.

At a later time, as the waves pass each other, which of the following shapes (of the 4 shown) will NOT be observed instantaneously at some point during the passage? Circle that shape.

Problem 8 (8 pts, show your work):

Below is a sketch of a transverse wave on a string at time t=0. The wave moves to the left with time from your point of view. The divisions in x and in y are 1 meter apart. The bit of string at point P executes simple harmonic motion in the y direction with a period of 0.5 seconds.

What is the speed of the wave?

$$\lambda = 16m$$
 $T = 0.5S$
 $V = \frac{\lambda}{T} = \frac{16}{0.5} = 32 \frac{m}{S}$

Write down a mathematical description of the wave, i.e. y(x,t) = ?

Problem 9 (13 pts, show your work):

Deep in the bottom of a pool of water, a mass of 2 is slides down a frictionless inclined plane that makes an angle of 60 degrees with the horizontal. The mass begins from rest at a distance h = 1.5 meters above the bottom of the pool. After reaching the bottom of the inclined plane, the mass slides across a horizontal surface into a wall. The horizontal surface is frictionless along the path of the mass except for a distance d=2 meters where the mass encounters friction as it slides on the floor of the pool ($\mu_k = 0.3$). Assume the mass has a volume of 0.001 m³ and has a density of 3500 kg/m³. Assume the density of water is 1000 kg/m³. Neglect the viscosity of the water, i.e. assume the mass passes through the water without any resistance (not a good assumption in real life, but who cares?).

How fast is the mass going when it strikes the wall?

NAME Soln key -

Problem 10 (13 pts, show your work):

Consider the two thin rods that make up a rigid body rotating about a vertical axis as shown in the sketch below. Each rod in the rigid object has length L and mass M and has a mass uniform mass per unit length, λ , equal to M/L. Each of the two rods in the rigid body make an angle of 45 degrees with the vertical. Determine the moment of inertia of this object about the vertical axis shown in terms of the variables M and L.
