

Boundary value problems in magnetostatics

Scalar Magnetic Potential

Because of the vector character of the equation

$$-\nabla^2 \vec{A} = \frac{4\pi}{c} \vec{j}$$

and the fact that $\nabla^2 \vec{A}$ only has a convenient representation in Cartesian coordinates, many of the methods we used to solve the scalar $-\nabla^2 \phi = 4\pi \rho$ don't work so well for magnetostatics.

However, in situations where the current \vec{j} is confined to certain surfaces, we can make things much closer to the electrostatic case by using the trick of the scalar magnetic potential ϕ_M .

In regions where $\vec{j} = 0$, i.e. not on the certain surfaces, we have $\vec{\nabla} \cdot \vec{B} = 0$ and $\vec{\nabla} \times \vec{B} = 0$. Since $\vec{\nabla} \times \vec{B} = 0$ in these regions we can define a scalar potential ϕ_M such that

$$\vec{B} = -\vec{\nabla} \phi_M$$

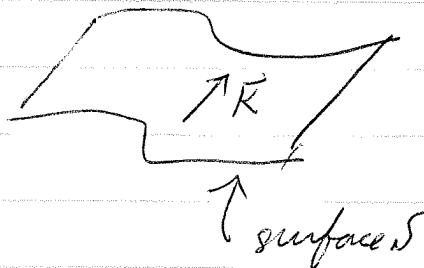

and then

$$\vec{\nabla} \cdot \vec{B} = -\vec{\nabla}^2 \phi_M = 0$$

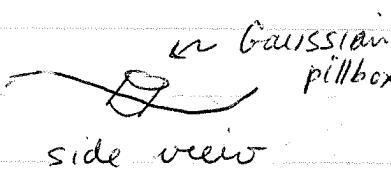

We can solve for ϕ_M as in electrostatics, and match solutions by applying appropriate boundary conditions on the current carrying surfaces.

Boundary conditions at sheet current

in magnetostatics $\vec{\nabla} \cdot \vec{B} = 0$, $\vec{\nabla} \times \vec{B} = \frac{4\pi}{c} \vec{J}$

surface current $\vec{K}(r)$ at pt r
on surface S

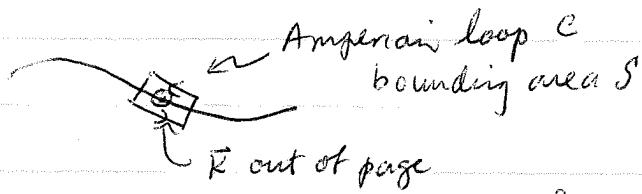

$$\text{in Gaussian pillbox vol } V \quad \int_V d^3r \vec{\nabla} \cdot \vec{B} = 0$$

side view

top + bottom area of pill box is da
width of pill box $\rightarrow 0$

$$\Rightarrow \int_V d^3r \vec{\nabla} \cdot \vec{B} = \oint_S da \hat{n} \cdot \vec{B} = da (\vec{B}_{\text{above}} - \vec{B}_{\text{below}}) : \hat{n} = 0$$

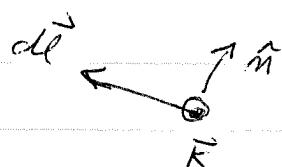

normal component of \vec{B} is continuous $(\vec{B}_{\text{above}} - \vec{B}_{\text{below}}) : \hat{n} = 0$

side view

$$\oint_S da \hat{n} \cdot (\vec{\nabla} \times \vec{B}) = \oint_C \vec{B} \cdot d\vec{l} = \frac{4\pi}{c} I_{\text{enclosed}}$$

let width of loop $\rightarrow 0$, top + bottom sides $d\vec{l}$

$$(\hat{n} \times d\vec{l}) \cdot \vec{K}$$

$$(\vec{B}_{\text{above}} - \vec{B}_{\text{below}}) \cdot d\vec{l} = \frac{4\pi}{c} (\vec{K} \times \hat{n}) \cdot d\vec{l}$$

$$= \frac{4\pi}{c} (\vec{K} \times \hat{n}) \cdot d\vec{l}$$

\hat{n} is outward
normal

tangential component of \vec{B} has
discontinuous jump $\frac{4\pi}{c} \vec{K} \times \hat{n}$

Combine both results into

$$\boxed{\vec{B}_{\text{above}} - \vec{B}_{\text{below}} = \frac{4\pi}{c} \vec{K} \times \hat{m}}$$

magnetic analog of $\vec{E}_{\text{above}} - \vec{E}_{\text{below}} = 4\pi\sigma \hat{m}$

In terms of magnetic ~~scalar~~ potential ϕ_m

$$-\vec{\nabla}\phi_{M\text{ above}} + \vec{\nabla}\phi_{M\text{ below}} = \frac{4\pi}{c} \vec{K} \times \hat{m}$$

Note: ϕ_m is a calculational tool only
it does not have any direct physical
significance as does the electrostatic ϕ .

Electrostatic ϕ is related to work done

moving a charge $W_{12} = q [\phi(r_2) - \phi(r_1)]$

nothing similar for ϕ_m .

(in fact magnetostatic magnetic forces do no work!)

$$\begin{aligned} \vec{F} &= q \vec{v} \times \vec{B} \\ \Rightarrow \vec{F} \cdot \vec{v} &= \frac{dW}{dt} = 0 \end{aligned}$$

Note: We cannot apply argument $\phi(r) - \phi(r') = \int \vec{E} \cdot d\vec{l}$
 ϕ_m is not necessarily continuous at surface 'r'
current

Cannot do similar to electrostatics and use

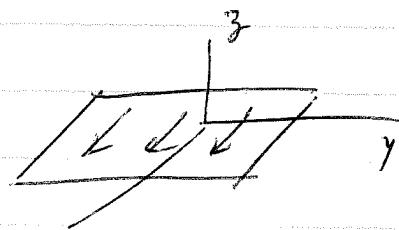

$$\phi_m(r_{\text{above}}) - \phi_m(r_{\text{below}}) = - \int_{r_{\text{below}}}^{r_{\text{above}}} \vec{B} \cdot d\vec{l}$$

Since ϕ_m is not defined on the current sheet
itself, separating "above" from "below".

example

Flat infinite plane at $z=0$ with surface current

$$\vec{K} = K \hat{x}$$

$$z \geq 0, \nabla^2 \phi_M^> = 0 \Rightarrow \phi_M^> = a^> - b_x^> x - b_y^> y - b_z^> z$$

$$z < 0, \nabla^2 \phi_M^< = 0 \Rightarrow \phi_M^< = a^< - b_x^< x - b_y^< y - b_z^< z$$

$$z \geq 0, \vec{B}^> = -\vec{\nabla} \phi_M^> = b_x^> \hat{x} + b_y^> \hat{y} + b_z^> \hat{z}$$

$$z < 0, \vec{B}^< = -\vec{\nabla} \phi_M^< = b_x^< \hat{x} + b_y^< \hat{y} + b_z^< \hat{z}$$

$$\text{at } z=0 \quad \vec{B}^> - \vec{B}^< = (b_x^> - b_x^<) \hat{x} + (b_y^> - b_y^<) \hat{y} + (b_z^> - b_z^<) \hat{z}$$

$$= \frac{4\pi K}{c} \hat{x} \times \hat{z} = \frac{4\pi K}{c} (\hat{x} \times \hat{z}) = -\frac{4\pi K}{c} \hat{y}$$

$$\Rightarrow b_x^> = b_x^< = b_{x0}, \quad b_z^> = b_z^< = b_{z0}, \quad b_y^> - b_y^< = -\frac{4\pi K}{c}$$

define $b_y^> = b_{y0} + s b_y \quad \Rightarrow \quad s b_y = -\frac{2\pi K}{c}$
 $b_y^< = b_{y0} - s b_y$

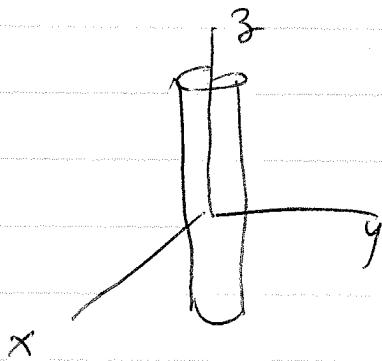

$$\Rightarrow \vec{B}^> = \vec{B}_0 - \frac{2\pi K}{c} \hat{y} \quad \vec{B}_0 = b_{x0} \hat{x} + b_{y0} \hat{y} + b_{z0} \hat{z}$$

$$\vec{B}^< = \vec{B}_0 + \frac{2\pi K}{c} \hat{y}$$

if \vec{K} is the only source of magnetic field then $\vec{B}_0 = 0$

$$\vec{B} = \begin{cases} -\frac{2\pi K}{c} \hat{y} & z \geq 0 \\ \frac{2\pi K}{c} \hat{y} & z < 0 \end{cases}$$

example current carrying infinite cylinder radius R

- (i) $\vec{K} = K \hat{z}$ wire with surface current
 (ii) $\vec{K} = K \hat{\phi}$ solenoid

(i) $\vec{K} = K \hat{z}$ $2\pi R K = I$ total current
 ↪ "guess" + show it is correct

$$\begin{array}{ll} r > R & \boxed{\Phi_M = -\frac{4\pi R K \varphi}{c}} \\ r < R & \boxed{\Phi_M = 0} \end{array} \quad \text{magnetic scalar potential} \quad \nabla^2 \Phi_M = 0$$

$$\begin{array}{ll} r > R & \vec{B} = -\vec{\nabla} \Phi_M = -\frac{1}{r} \frac{\partial \Phi_M}{\partial \varphi} \hat{\varphi} = \frac{4\pi R K}{cr} \hat{\varphi} = \boxed{\frac{2I}{cr} \hat{\varphi}} \\ r < R & \vec{B} = 0 \end{array} \quad \begin{matrix} \leftarrow \text{familiar} \\ \text{result} \\ \text{from} \\ \text{Ampere} \end{matrix}$$

$$\vec{B}_{\text{above}} - \vec{B}_{\text{below}} = \frac{2I}{cr} \hat{\varphi} = \frac{4\pi K}{c} \frac{R}{r} \hat{\varphi} = \frac{4\pi K}{c} \vec{r} \times \hat{m} \quad \begin{matrix} \text{where } \hat{m} = \hat{r} \\ \text{as } \hat{z} \times \hat{r} = \hat{\varphi} \end{matrix}$$

Note: $\Phi_M = -\frac{4\pi R K \varphi}{c}$ is not single valued!

would not have found this using expansion of separation of coords in polar coords

Φ_M does not need to be single valued since it has no physical significance. Only $\vec{B} = -\vec{\nabla} \Phi_M$ is physical

(ii) $\vec{K} = K \hat{\varphi}$

$$r > R \quad \Phi_M = -B_1 \hat{z} \quad \nabla^2 \Phi_M = 0$$

$$r < R \quad \Phi_M = -B_2 \hat{z}$$

$$r > R \quad \vec{B} = -\vec{\nabla} \Phi_M = B_1 \hat{z}$$

$$r < R \quad \vec{B} = -\vec{\nabla} \Phi_M = B_2 \hat{z}$$

$$\vec{B}_{\text{above}} - \vec{B}_{\text{below}} = (B_1 - B_2) \hat{z} = \frac{4\pi}{c} K \times \hat{n}$$

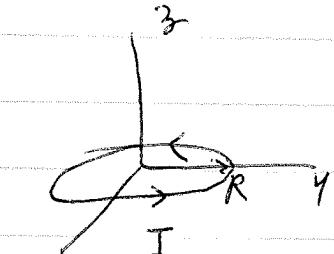

$$= \frac{4\pi}{c} K (\hat{\phi} \times \hat{r})$$

$$= -\frac{4\pi}{c} K \hat{z}$$

If current in solenoid is only source of \vec{B} Then expect $B_1 = 0$

$$\Rightarrow \boxed{\vec{B}_2 = \frac{4\pi}{c} K \hat{z}} \quad \text{familiar result}$$

example circular current loop in xy plane
 radius R

$$\text{for } r > R, \vec{\nabla} \times \vec{B} = 0 \Rightarrow \vec{B} = -\vec{\nabla} \phi_M$$

where $\nabla^2 \phi_M = 0$.

x

Try Legendre polynomial expansion for ϕ_M

$$\phi_M = \sum_{\ell=0}^{\infty} \frac{B_e}{r^{\ell+1}} P_\ell(\cos\theta) \quad (\text{A}_\ell \text{ terms vanish as want } B \rightarrow 0 \text{ as } r \rightarrow \infty)$$

$$\vec{B} = -\vec{\nabla} \phi_M = -\frac{\partial \phi_M}{\partial r} \hat{r} - \frac{1}{r} \frac{\partial \phi_M}{\partial \theta} \hat{\theta}$$

$$= \sum_{\ell} \left[\frac{(\ell+1)B_e}{r^{\ell+2}} P_\ell(\cos\theta) \hat{r} - \frac{B_e}{r^{\ell+2}} \frac{\partial P_\ell(\cos\theta)}{\partial \theta} \hat{\theta} \right]$$

write $\frac{\partial P_\ell}{\partial \theta} = \frac{\partial P_\ell}{\partial x} \frac{\partial x}{\partial \theta} = -\frac{\partial P_\ell}{\partial x} \sin\theta \quad x = \cos\theta$

$$= -P'_\ell \sin\theta$$

$$\vec{B} = \sum_{\ell} \left[\frac{(\ell+1)B_e}{r^{\ell+2}} P_\ell(\cos\theta) \hat{r} + \frac{B_e}{r^{\ell+2}} \sin\theta P'_\ell(\cos\theta) \hat{\theta} \right]$$

To determine the B_e we compare with exact solution along \hat{z} axis

$$\vec{B}(z\hat{z}) = \sum_{\ell} \frac{(\ell+1)B_e}{r^{\ell+2}} \hat{r} = \sum_{\ell} \frac{(\ell+1)B_e}{z^{\ell+2}} \hat{z}$$

since $P_e(1) = 1, \sin(0) = 0$ and $P'_e(1)$ finite, $\hat{r} = \hat{z}$, i.e. $r = z$

exact solution on \hat{z} axis:

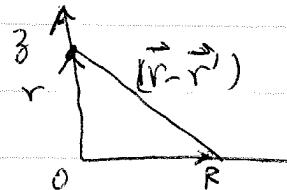

$$\vec{A} = \int_C \frac{d^3 r'}{|r - r'|} \hat{f}(r') \Rightarrow \vec{B}(r) = \vec{\nabla} \times \vec{A} = \int_C \frac{d^3 r'}{|r - r'|} \vec{\nabla} \times \frac{\hat{f}(r')}{|r - r'|}$$

$$\vec{B} = - \int_C \frac{d^3 r'}{|r - r'|} \hat{f}(r') \times \vec{\nabla} \left(\frac{1}{|r - r'|} \right)$$

$$\vec{B} = \int_C \frac{d^3 r'}{|r - r'|} \hat{f}(r') \times \frac{(r - r')}{|r - r'|^3}$$

Biot-Savart Law for
magnetostatics

For our loop

$$\vec{B}(z) = \int_0^{2\pi} d\phi \int_C R \hat{\phi} \times \frac{[-R \hat{r} + z \hat{z}]}{(z^2 + R^2)^{3/2}}$$

$$\hat{r} \times \hat{\phi} = \hat{z}$$

$$= \int_0^{2\pi} \frac{d\phi R (IR) \hat{z}}{(z^2 + R^2)^{3/2}}$$

$\hat{\phi} \times \hat{z}$ ten
integrates to zero

$$\boxed{\vec{B}(z) = \frac{2\pi R^2 I \hat{z}}{c(z^2 + R^2)^{3/2}}}$$

to match Legendre polynomial expansion, do Taylor series expansion
of above

$$\vec{B}(z) = \frac{2\pi R^2 I \hat{z}}{c z^3} \frac{1}{\left(1 + \left(\frac{R}{z}\right)^2\right)^{3/2}} = \frac{2\pi R^2 I \hat{z}}{z^3} \left\{ 1 - \frac{3}{2} \left(\frac{R}{z}\right)^2 + \dots \right\}$$

$$= \frac{2\pi R^2 I \hat{z}}{c} \left\{ \frac{1}{z^3} - \frac{3}{2} \frac{R^2}{z^5} + \dots \right\}$$

$$= \left\{ \frac{B_0}{z^2} + \frac{2B_1}{z^3} + \frac{3B_2}{z^4} + \frac{4B_3}{z^5} + \dots \right\} \hat{z}$$

$$\Rightarrow B_0 = 0, \quad B_1 = \frac{\pi R^2 I}{c} \hat{I}, \quad B_2 = 0, \quad B_3 = -\frac{3 \pi R^2 I R^2}{4c}$$

So to order $\mathcal{L}=3$

$$\vec{B}(\vec{r}) = \frac{\pi R^2 I}{c} \left\{ \frac{2 P_1(\cos\theta) \hat{r} + \sin\theta P'_1(\cos\theta) \hat{\theta}}{r^3} - \frac{[3R^2 P_3(\cos\theta) \hat{r} + \frac{3}{4} R^2 \sin\theta P'_3(\cos\theta) \hat{\theta}]}{r^5} \right\} + \dots$$

$$P_1(x) = x \Rightarrow P'_1(x) = 1$$

$$P_3(x) = \frac{1}{2}(5x^3 - 3x) \Rightarrow P'_3(x) = \frac{1}{2}(15x^2 - 3)$$

$$\vec{B}(\vec{r}) = \frac{\pi R^2 I}{c} \left\{ \frac{2 \cos\theta \hat{r} + \sin\theta \hat{\theta}}{r^3} - \frac{\frac{3}{2} R^2 (5 \cos^3\theta - 3 \cos\theta) \hat{r} + \frac{3}{8} R^2 \sin\theta (15 \cos^2\theta - 3) \hat{\theta}}{r^5} \right\} + \dots$$

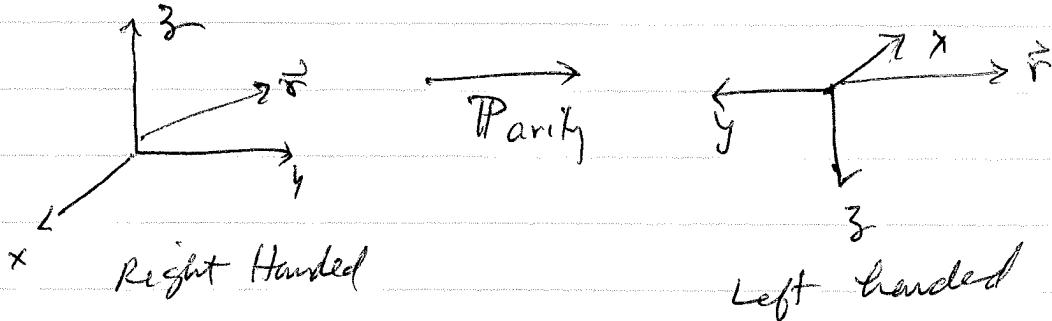

$\frac{\pi R^2 I}{c} = m$ is the magnetic dipole moment of the loop

We see that the 1st term is just the magnetic dipole approx. The 2nd term is the magnetic ~~quadrupole~~ ^{octupole} term. Could easily get higher order terms by this method.

Compare our result above to Jackson (5-40)

Symmetry under parity transformation

vector vs. pseudovector

$$\vec{r} = (x, y, z) \rightarrow (-x, -y, -z)$$

$$P(\vec{r}) = -\vec{r} \quad \text{position } \vec{r} \text{ is odd under parity}$$

Any vector-like quantity that is odd under P is a vector.

examples of vectors

position \vec{r}

velocity $\vec{v} = \frac{d\vec{r}}{dt}$ since \vec{r} is vector and t is scalar

acceleration $\vec{a} = \frac{d\vec{v}}{dt}$

$$P(t) = t$$

Force $\vec{F} = m\vec{a}$ since \vec{a} is vector and m is scalar

momentum $\vec{p} = m\vec{v}$, since \vec{v} is vector and m is scalar

electric field $\vec{F} = g\vec{E}$ since \vec{E} is vector and g is scalar

$$P(g) = g$$

current $\vec{j} = \sum_i j_i \vec{v}_i \delta(\vec{r} - \vec{r}_i(+))$

any vector-like quantity that is even under P is a pseudovector

angular momentum $\vec{L} = \vec{r} \times \vec{p}$ since $\vec{r} \rightarrow -\vec{r}$ and $\vec{p} \rightarrow \vec{p}$,
 $\vec{L} \rightarrow \vec{L}$ under P

\vec{L} is even under P

magnetic field $\vec{F} = q \vec{v} \times \vec{B}$ since \vec{F} and \vec{v} are vectors and
 q is scalar, \vec{B} must be ~~pseudovector~~ pseudovector,

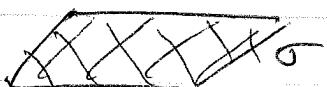

cross product of any two vectors is a pseudovector

" " " vector ad pseudovector is a vector

when solving for \vec{E} , it can only be made up of vectors that exist in the problem

When solving for \vec{B} , it can only be made up of pseudovectors that exist in the problem

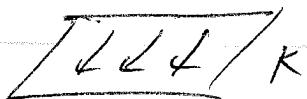

e.g. charged plane

only directions in problem is normal \hat{m}
 \hat{m} is a vector

$$\vec{E} \propto \hat{m}$$

surface current

only directions are the vectors \hat{m} ad \hat{K} . But \vec{B} can only be made of pseudovectors

$$\Rightarrow \vec{B} \propto (\vec{k} \times \hat{m})$$
