

Maxwell Relations

Follow from 2nd derivatives of the thermodynamic potential
Energy:

$$E(S, V, N) \Rightarrow \left(\frac{\partial E}{\partial S}\right)_{V,N} = T(S, V, N)$$

$$\text{so } \left(\frac{\partial^2 E}{\partial S \partial V}\right)_N = \left(\frac{\partial T}{\partial V}\right)_{S,N}$$

$$\text{but } \left(\frac{\partial E}{\partial V}\right)_{S,N} = -P(S, V, N)$$

$$\text{so } \left(\frac{\partial^2 E}{\partial V \partial S}\right)_N = -\left(\frac{\partial P}{\partial S}\right)_{V,N}$$

$$\Rightarrow \left(\frac{\partial T}{\partial V}\right)_{S,N} = -\left(\frac{\partial P}{\partial S}\right)_{V,N}$$

Can do the same for any thermodynamic potential
Helmholtz free energy

$$A(T, V, N) \Rightarrow -\left(\frac{\partial A}{\partial T}\right)_{V,N} = S(T, V, N)$$

$$\text{so } -\left(\frac{\partial^2 A}{\partial T \partial V}\right)_N = \left(\frac{\partial S}{\partial V}\right)_{T,N}$$

$$\text{but: } -\left(\frac{\partial A}{\partial V}\right)_{T,N} = P(T, V, N)$$

$$\text{so } -\left(\frac{\partial^2 A}{\partial V \partial T}\right)_N = \left(\frac{\partial P}{\partial T}\right)_{V,N}$$

$$\Rightarrow \left(\frac{\partial S}{\partial V}\right)_{T,N} = \left(\frac{\partial P}{\partial T}\right)_{V,N}$$

Or Gibbs free energy

$$G(T, p, N) \Rightarrow \left(\frac{\partial G}{\partial p}\right)_{T,N} = V(T, p, N)$$

so $\left(\frac{\partial^2 G}{\partial p \partial N}\right)_T = \left(\frac{\partial V}{\partial N}\right)_{T,p}$

but

$$\left(\frac{\partial G}{\partial N}\right)_{T,p} = \mu(T, p, N)$$

so $\left(\frac{\partial^2 G}{\partial N \partial p}\right)_T = \left(\frac{\partial \mu}{\partial p}\right)_{T,N}$

$\Rightarrow \left(\frac{\partial V}{\partial N}\right)_{T,p} = \left(\frac{\partial \mu}{\partial p}\right)_{T,N}$

These equivalences, which follow from the independence of the order of taking 2nd derivatives, are called the Maxwell Relations

See Callen Chpt 7 for a complete list

Response functions

specific heat at const volume $C_V = \left(\frac{\partial Q}{\partial T}\right)_{V,N} = T \left(\frac{\partial S}{\partial T}\right)_{V,N}$

specific heat at const pressure $C_P = \left(\frac{\partial Q}{\partial T}\right)_{P,N} = T \left(\frac{\partial S}{\partial T}\right)_{P,N}$

isothermal compressibility $\kappa_T = -\frac{1}{V} \left(\frac{\partial V}{\partial P}\right)_{T,N}$

adiabatic compressibility $\kappa_S = -\frac{1}{V} \left(\frac{\partial V}{\partial P}\right)_{S,N}$

coefficient of thermal expansion $\alpha = \frac{1}{V} \left(\frac{\partial V}{\partial T}\right)_{P,N}$

All the above may be viewed as a second derivative of an appropriate thermodynamic potential

$$C_V = T \left(\frac{\partial S}{\partial T}\right)_V = -T \left(\frac{\partial^2 A}{\partial T^2}\right)_{V,N} \quad \text{since } \left(\frac{\partial A}{\partial T}\right)_{V,N} = -S(T, V, N)$$

$$C_P = + \left(\frac{\partial S}{\partial T}\right)_P = -T \left(\frac{\partial^2 G}{\partial T^2}\right)_{P,N} \quad \text{since } \left(\frac{\partial G}{\partial T}\right)_{P,N} = -S(T, P, N)$$

$$\kappa_T = -\frac{1}{V} \left(\frac{\partial V}{\partial P}\right)_T = -\frac{1}{V} \left(\frac{\partial^2 G}{\partial P^2}\right)_{T,N} \quad \text{since } \left(\frac{\partial G}{\partial P}\right)_{T,N} = V(T, P, N)$$

$$\kappa_S = -\frac{1}{V} \left(\frac{\partial V}{\partial P}\right)_S = -\frac{1}{V} \left(\frac{\partial^2 H}{\partial P^2}\right)_{S,N} \quad \text{since } \left(\frac{\partial H}{\partial P}\right)_{S,N} = V(S, P, N)$$

$$\alpha = \frac{1}{V} \left(\frac{\partial V}{\partial T}\right)_P = \frac{1}{V} \left(\frac{\partial^2 G}{\partial T \partial P}\right)_N \quad \text{since } \left(\frac{\partial G}{\partial P}\right)_{T,N} = V(T, P, N)$$

Since all the various thermodynamic potentials can all be derived from one another, the various second derivatives must ~~not~~ be related. If we consider

cases where N is held constant (as in all the above response functions) then there ~~are only~~ can be only three independent second derivatives, for example

$$\left(\frac{\partial^2 G}{\partial T^2}\right)_{P,N} = -C_P/T$$

$$\left(\frac{\partial^2 G}{\partial P^2}\right)_{T,N} = -V K_T$$

$$\left(\frac{\partial^2 G}{\partial T \partial P}\right)_N = \gamma \alpha$$

All the other second derivatives of the other potentials must be some combination of these three.

Consider C_V we will show how to write it in terms of the above.

Consider Helmholtz free energy $A(T, V)$ since N is kept constant, we will not write it

$$-S(T, V) = \left(\frac{\partial A}{\partial T}\right)_V$$

viewing S as a function of T , and V we have

$$dS = \left(\frac{\partial S}{\partial T}\right)_V dT + \left(\frac{\partial S}{\partial V}\right)_T dV$$

$$\Rightarrow T \left(\frac{\partial S}{\partial T}\right)_P = T \left(\frac{\partial S}{\partial T}\right)_V + T \left(\frac{\partial S}{\partial V}\right)_T \left(\frac{\partial V}{\partial T}\right)_P$$

$$\Rightarrow C_p = C_V + T \left(\frac{\partial S}{\partial V} \right)_T \left(\frac{\partial V}{\partial T} \right)_p$$

$$\text{Now } \left(\frac{\partial S}{\partial V} \right)_T = - \frac{\partial^2 A}{\partial T \partial V} = \left(\frac{\partial p}{\partial T} \right)_V$$

and $\left(\frac{\partial p}{\partial T} \right)_V \left(\frac{\partial T}{\partial V} \right)_p \left(\frac{\partial V}{\partial p} \right)_T = -1$ \leftarrow (see general result next page)

$$\text{So } \left(\frac{\partial p}{\partial T} \right)_V = \frac{-1}{\left(\frac{\partial T}{\partial V} \right)_p \left(\frac{\partial V}{\partial p} \right)_T} = - \frac{\left(\frac{\partial V}{\partial T} \right)_p}{\left(\frac{\partial V}{\partial p} \right)_T}$$

$$C_p = C_V - T \left(\frac{\partial V}{\partial T} \right)_p \frac{\left(\frac{\partial V}{\partial T} \right)_p}{\left(\frac{\partial V}{\partial p} \right)_T}$$

$$= C_V - T \frac{(V\alpha)^2}{-V K_T} = C_V + T V \frac{\alpha^2}{K_T}$$

$$\text{So } C_V = C_p - \frac{T V \alpha^2}{K_T}$$

A general result for partial derivatives

Consider any three variables satisfying a constraint

$f(x, y, z) = 0 \Rightarrow z$ for example, is function of x and y
or y is function of x, z etc.

\Rightarrow exists a relation between partial derivatives of the
variables with respect to each other.

$$\text{constraint} \Rightarrow df = \left(\frac{\partial f}{\partial x}\right)_{y,z} dx + \left(\frac{\partial f}{\partial y}\right)_{x,z} dy + \left(\frac{\partial f}{\partial z}\right)_{x,y} dz = 0$$

if hold z const, ie $dz = 0$, then

$$\left(\frac{\partial x}{\partial y}\right)_z = -\frac{\left(\frac{\partial f}{\partial y}\right)_{x,z}}{\left(\frac{\partial f}{\partial x}\right)_{y,z}}$$

if hold y const, ie $dy = 0$, then

$$\left(\frac{\partial x}{\partial z}\right)_y = -\frac{\left(\frac{\partial f}{\partial z}\right)_{y,z}}{\left(\frac{\partial f}{\partial x}\right)_{y,z}}$$

if hold x const, ie $dx = 0$, then

$$\left(\frac{\partial y}{\partial z}\right)_x = -\frac{\left(\frac{\partial f}{\partial z}\right)_{x,y}}{\left(\frac{\partial f}{\partial y}\right)_{x,z}}$$

Multiplying together we get

$$\left(\frac{\partial x}{\partial y}\right)_z \left(\frac{\partial y}{\partial z}\right)_x \left(\frac{\partial z}{\partial x}\right)_y = -1$$

(x, y, z) with constraint among them

Solve for $x(y, z)$ or for $y(x, z)$

then $dx = \left(\frac{\partial x}{\partial y}\right)_z dy + \left(\frac{\partial x}{\partial z}\right)_y dz \quad \textcircled{1}$

$$dy = \left(\frac{\partial y}{\partial x}\right)_z dx + \left(\frac{\partial y}{\partial z}\right)_x dz \quad \textcircled{2}$$

Suppose way dx keeping $dz = 0$

$$\textcircled{1} \Rightarrow dx = \left(\frac{\partial x}{\partial y}\right)_z dy \Rightarrow \frac{dy}{dx} = \frac{1}{\left(\frac{\partial x}{\partial y}\right)_z}$$

$$\textcircled{2} \Rightarrow dy = \left(\frac{\partial y}{\partial x}\right)_z dx \Rightarrow \frac{dx}{dy} = \left(\frac{\partial x}{\partial y}\right)_z$$

$$\Rightarrow \boxed{\left(\frac{\partial y}{\partial x}\right)_z = \frac{1}{\left(\frac{\partial x}{\partial y}\right)_z}}$$

Similarly we must be able to write k_s in terms of c_p, k_T, α

Consider enthalpy $H(s, p)$

$$\left(\frac{\partial H}{\partial p}\right)_S = v(s, p)$$

regarding v as a function of s and p we have

$$dv = \left(\frac{\partial v}{\partial p}\right)_S dp + \left(\frac{\partial v}{\partial s}\right)_p ds$$

$$-\frac{1}{v} \left(\frac{\partial v}{\partial p}\right)_T = -\frac{1}{v} \left(\frac{\partial v}{\partial p}\right)_S - \frac{1}{v} \left(\frac{\partial v}{\partial s}\right)_p \left(\frac{\partial s}{\partial p}\right)_T$$

$$k_T = k_S - \frac{1}{v} \left(\frac{\partial v}{\partial s}\right)_p \left(\frac{\partial s}{\partial p}\right)_T$$

$$\text{Now } \left(\frac{\partial s}{\partial p}\right)_T = -\frac{\partial^2 G}{\partial T \partial p} = -\left(\frac{\partial v}{\partial T}\right)_p$$

$$\text{and } \left(\frac{\partial v}{\partial s}\right)_p = \frac{\left(\frac{\partial v}{\partial T}\right)_p}{\left(\frac{\partial s}{\partial T}\right)_p}$$

$$\text{above follows from: } \frac{\partial G}{\partial p} = v(T, p) \Rightarrow dv = \left(\frac{\partial v}{\partial T}\right)_p dT + \left(\frac{\partial v}{\partial p}\right)_T dp$$

$$-\frac{\partial G}{\partial T} = s(T, p) \Rightarrow ds = \left(\frac{\partial s}{\partial T}\right)_p dT + \left(\frac{\partial s}{\partial p}\right)_T dp$$

$$\Rightarrow \left(\frac{\partial v}{\partial s}\right)_p = \frac{\left(\frac{\partial v}{\partial T}\right)_p}{\left(\frac{\partial s}{\partial T}\right)_p}$$

$$\text{or in general } \left(\frac{\partial \beta}{\partial y}\right)_x = \frac{\left(\frac{\partial \beta}{\partial u}\right)_x}{\left(\frac{\partial y}{\partial u}\right)_x}$$

substitute in to get

$$k_T = k_S + \frac{1}{V} \left(\frac{\partial V}{\partial T} \right)_P \frac{\left(\frac{\partial V}{\partial T} \right)_P}{\left(\frac{\partial S}{\partial T} \right)_P} = k_S + \frac{1}{V} \frac{(V\alpha)^2}{C_P T}$$

$$k_T = k_S + \frac{TV\alpha^2}{C_P}$$

$$k_S = k_T - \frac{TV\alpha^2}{C_P}$$

See Callen for a systematic way to reduce all such derivatives to combinations of C_P , k_T , α

The main point is not to remember how to do this, but that it can be done! There are only a finite number of independent 2nd derivatives of the thermodynamic potentials! [if consider only ~~N~~ N fixed, there are only C_P , k_T , α]

Another useful relation

$$C_V = T \left(\frac{\partial S}{\partial T} \right)_V$$

$$\text{since } dE = TdS - pdV \quad (N \text{ fixed})$$

it follows that

$$C_V = \left(\frac{\partial E}{\partial T} \right)_V = T \left(\frac{\partial S}{\partial T} \right)_V$$
